

Quality tubing cuts plating costs.

Premium Surface Tubing Saves Money.

Low price conventional tubing actually costs you more than Quality Premium Surface Tubing after buffing, polishing and plating costs are taken into consideration.

Quality tubing is a better value that saves you money.

Microscopic peaks and valleys on the surface finish of steel tubing are expensive. They cost more to process for plating applications because they need buffing and polishing. They also cost more to plate because the peaks and valleys spread out in fabrication, requiring more plating material.

Welded Tubes Quality Premium Surface Tubing doesn't need any costly buffing and polishing. It also requires less plating material than the conventional tubing and generates less scrap.

This means you can save approximately 20 to 30 percent net in the cost of your plated part with our Quality Premium Surface Tubing—a bottom line difference that makes it worth your while to contact us for all the money-saving details.

High frequency electric resistance welding forms a strong, smooth, undetectable bond on the plated piece.
